

Computer Security Capstone

Project II: MITM and Pharming Attacks in Wi-Fi Networks

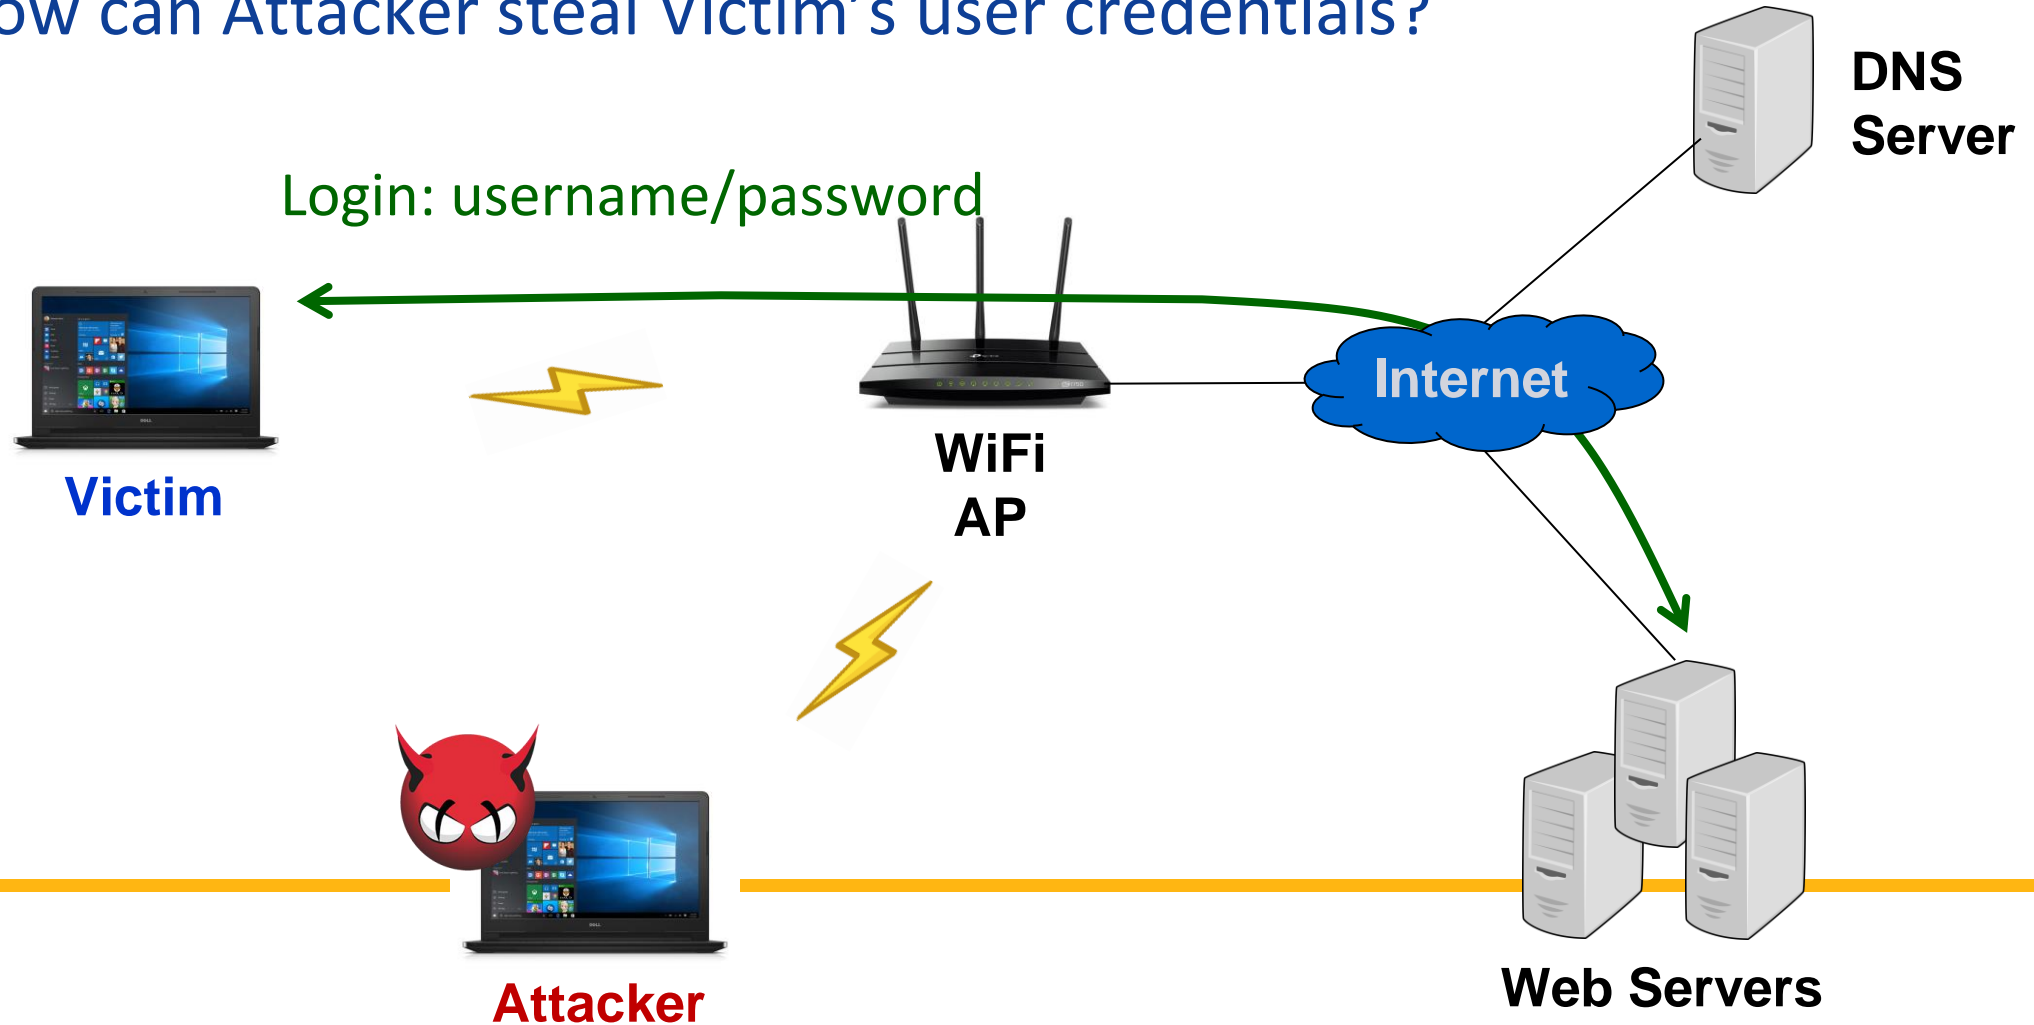

Chi-Yu Li (2023 Spring)
Computer Science Department
National Yang Ming Chiao Tung University

Goal

- Understand how user credentials can be leaked by a man-in-the-middle (MITM) attack over Wi-Fi networks
- You will learn how to
 - ❑ scan IP/MAC addresses of the devices in a Wi-Fi network
 - ❑ launch an ARP spoofing attack
 - ❑ launch a man-in-the-middle attack
 - ❑ launch a pharming attack

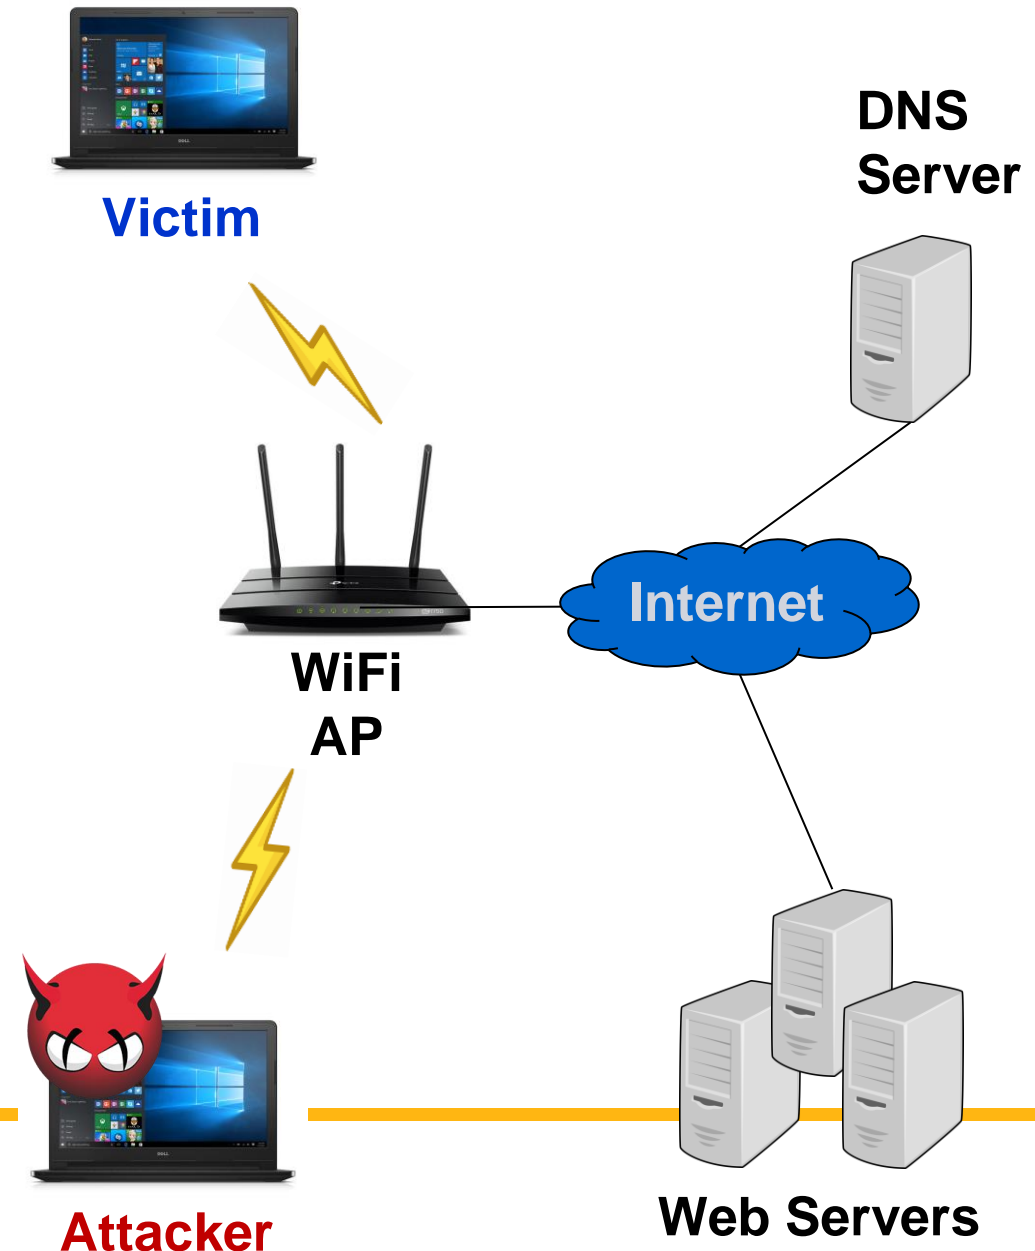

Attack Scenario

- How can Attacker steal Victim's user credentials?

Major Ideas

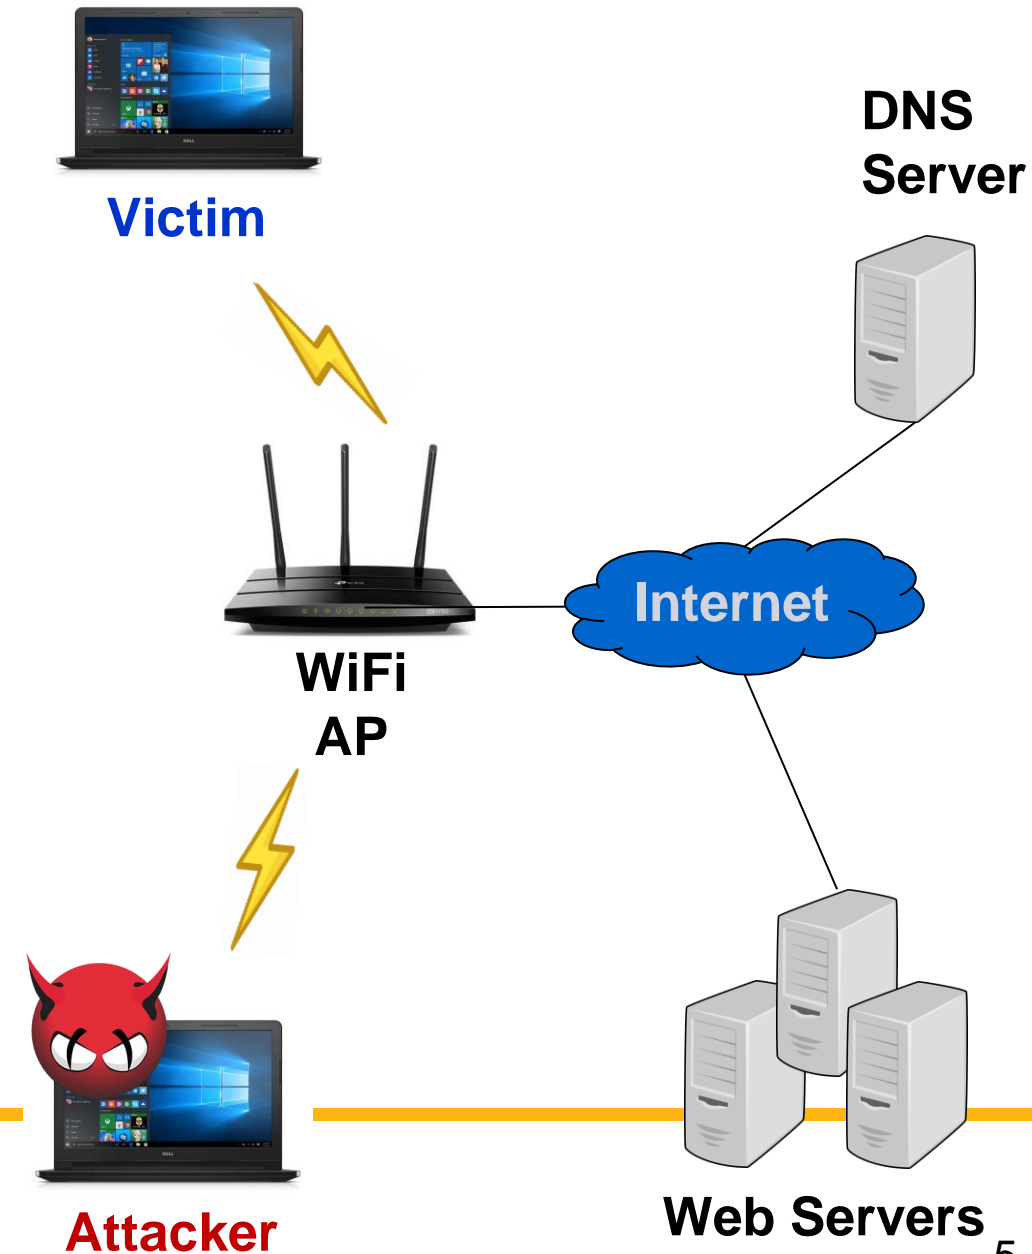

- Redirect Victim's traffic to Attacker
 - ❑ Man-in-the-middle based on ARP spoofing
 - ❑ How to know Victim's IP/MAC address?
- How about encrypted sessions?
 - ❑ MITM attack: split the encrypted sessions
 - ❑ Pharming attack: redirect HTTP requests to a phishing web page

Tasks: MITM and Pharming

- **MITM Attack (60%)**

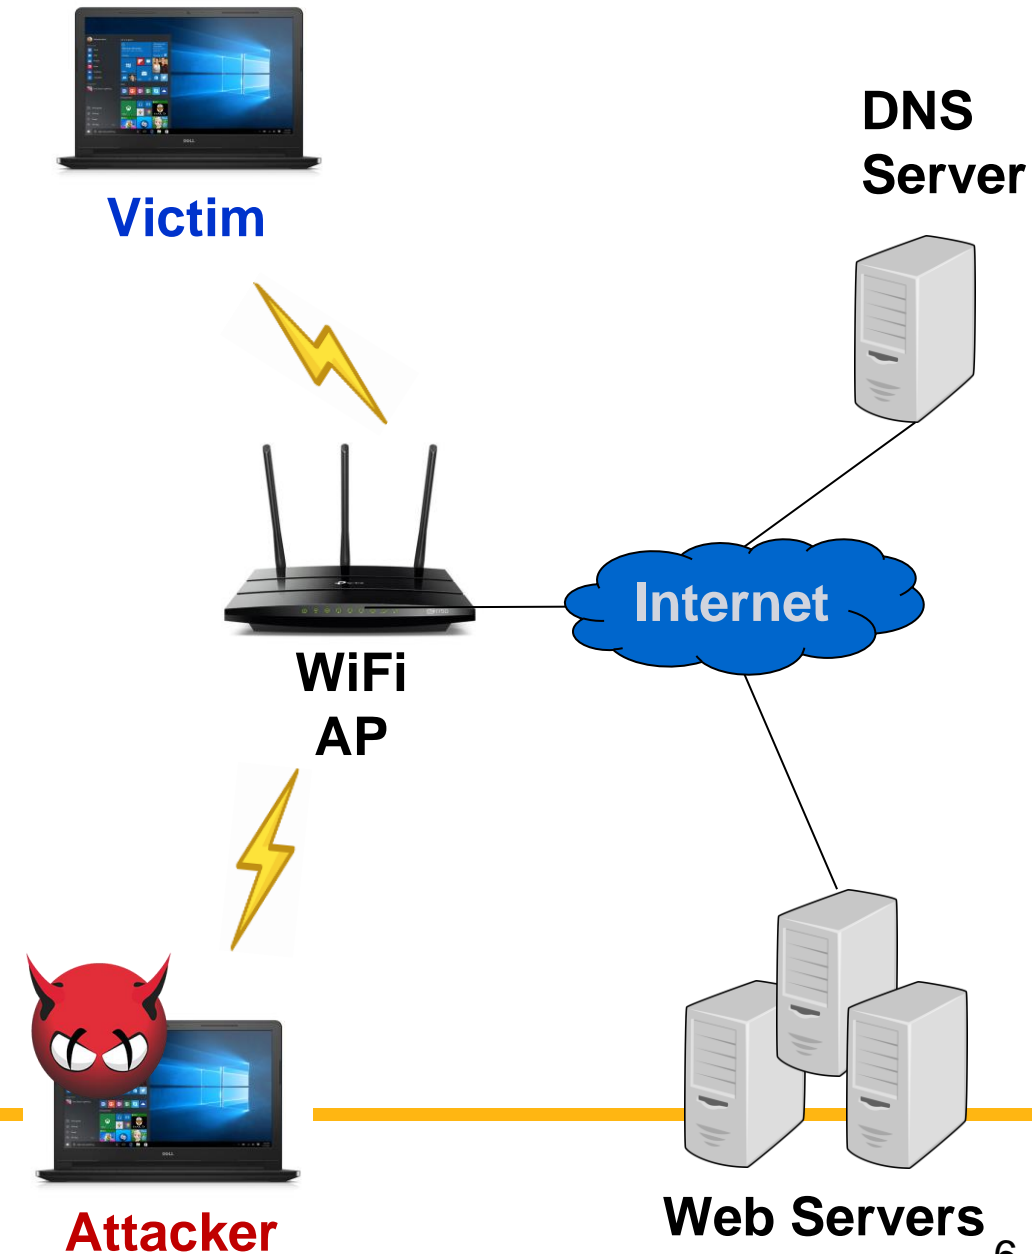

- ❑ Obtain all other client devices' IP/MAC addresses in a connected Wi-Fi network (Task I: 20%)
- ❑ ARP spoofing for all other client devices in the Wi-Fi network (Task II: 15%)
- ❑ Split SSL/TLS encrypted sessions and get the inputted username/password strings from HTTPS sessions (Task III: 15%)
- ❑ One implementation question during the demo (10%)

Tasks: MITM and Pharming

- **Pharming Attack (40%)**

- ❑ Obtain all other client devices' IP/MAC addresses in a connected Wi-Fi network
- ❑ DNS spoofing attack for web services (Task IV: 30%)
- ❑ One implementation question during the demo (10%)

Task I: Device Address Information Collection

- Scan all the devices' IP/MAC addresses in the Wi-Fi network
 - You can use 'scapy' and 'netifaces' library in Python or commands 'nmap', 'arp', and 'route'

```
cs2021@ubuntu:~/Desktop/project2$ sudo ./mitm_attack
Available devices
-----
IP                MAC
-----
172.16.186.1      00:50:56:c0:00:08
172.16.186.141    00:0c:29:f2:d2:ab
172.16.186.254    00:50:56:ed:bd:5e
```

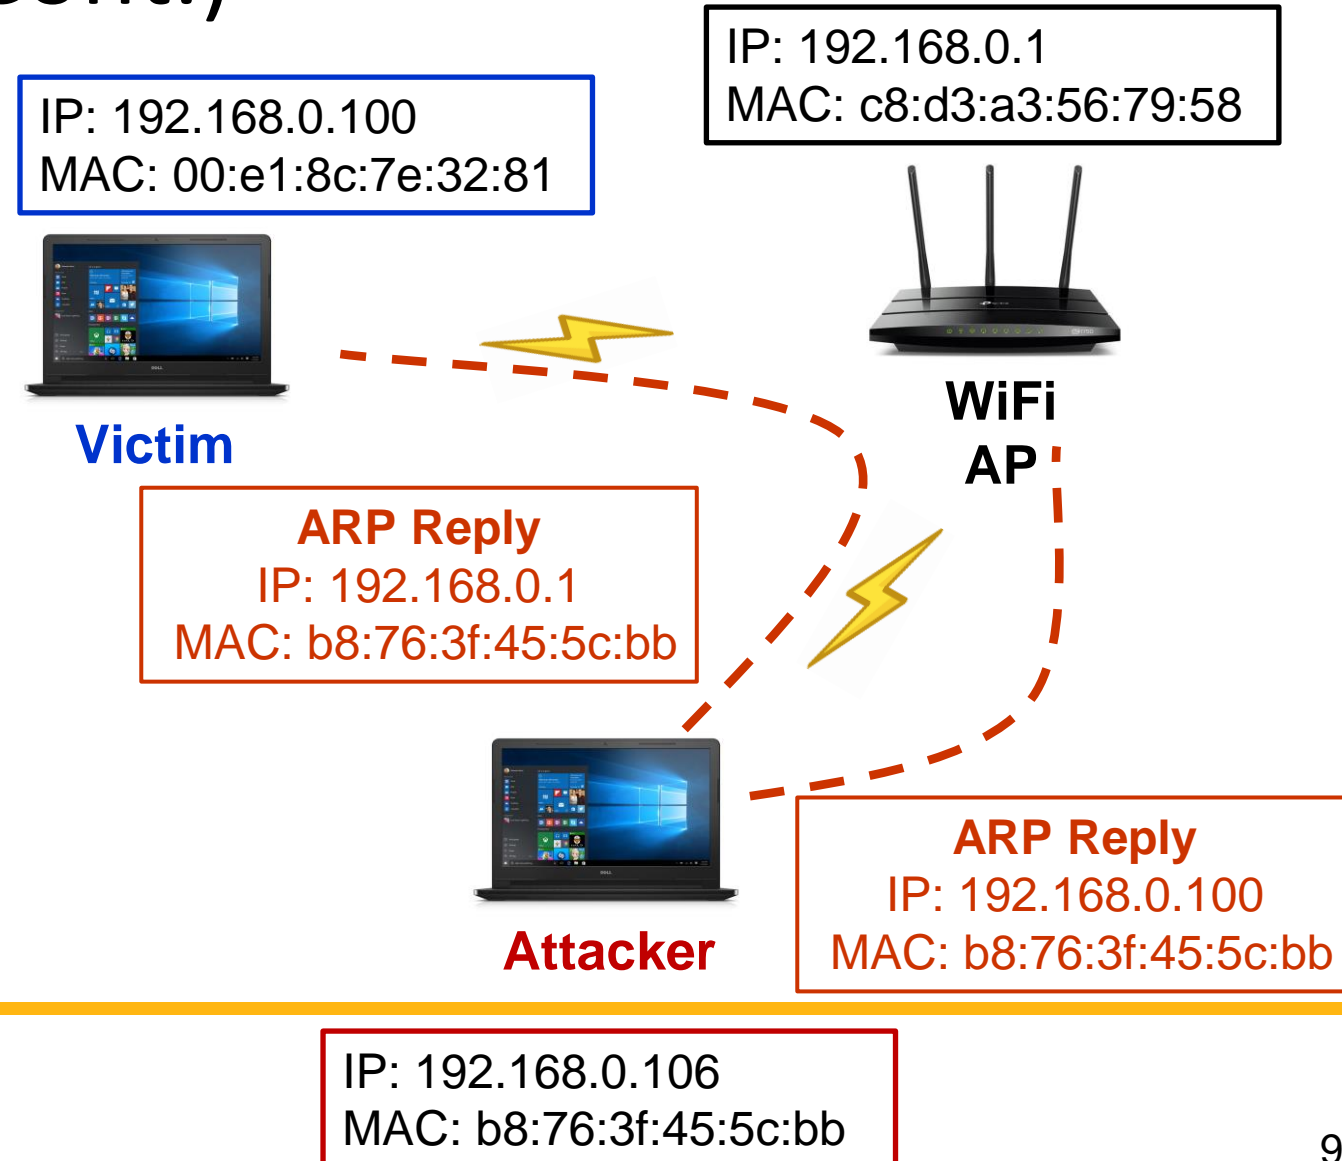

- Fetch the IP/MAC addresses of all the other client devices

Task II: ARP Spoofing

- What is ARP (Address Translation Protocol)?
 - ❑ A communication protocol: discovering the link layer (or MAC) address associated with a given IP
 - ❑ A request-response protocol: messages are encapsulated by a link-layer protocol
 - ARP request: broadcast
 - ARP response: unicast
 - ❑ Never routed across internetworking nodes

Task II: ARP Spoofing (Cont.)

- Generate spoofed ARP replies for all other client devices
 - ❑ You can use 'scapy' library in Python
- Both uplink and downlink should be considered
 - ❑ Other client devices' network services can work normally

Task II: ARP Spoofing (Cont.)

- An example trace of the successful ARP spoofing at Attacker

The image displays a Wireshark packet capture of an ICMP echo (ping) session. The capture shows four packets (2743-2746) on interface 0. The first two packets (2743 and 2744) are requests from the victim (192.168.0.100) to the attacker (8.8.8.8). The next two packets (2745 and 2746) are replies from the attacker back to the victim. The packet details pane for each packet shows the Ethernet II and Internet Protocol (IP) headers, with the source and destination MAC and IP addresses highlighted in red boxes to show the flow of traffic.

No.	Time	Source	Destination	Protocol	Length	Info
2743	152.022717290	192.168.0.100	8.8.8.8	ICMP	74	Echo (ping) request id=0x0001, seq=327/18177, ttl=128
2744	152.025483284	192.168.0.100	8.8.8.8	ICMP	74	Echo (ping) request id=0x0001, seq=327/18177, ttl=128
2745	152.049717459	8.8.8.8	192.168.0.100	ICMP	74	Echo (ping) reply id=0x0001, seq=327/18177, ttl=121
2746	152.053411633	8.8.8.8	192.168.0.100	ICMP	74	Echo (ping) reply id=0x0001, seq=327/18177, ttl=121

Victim → Attacker

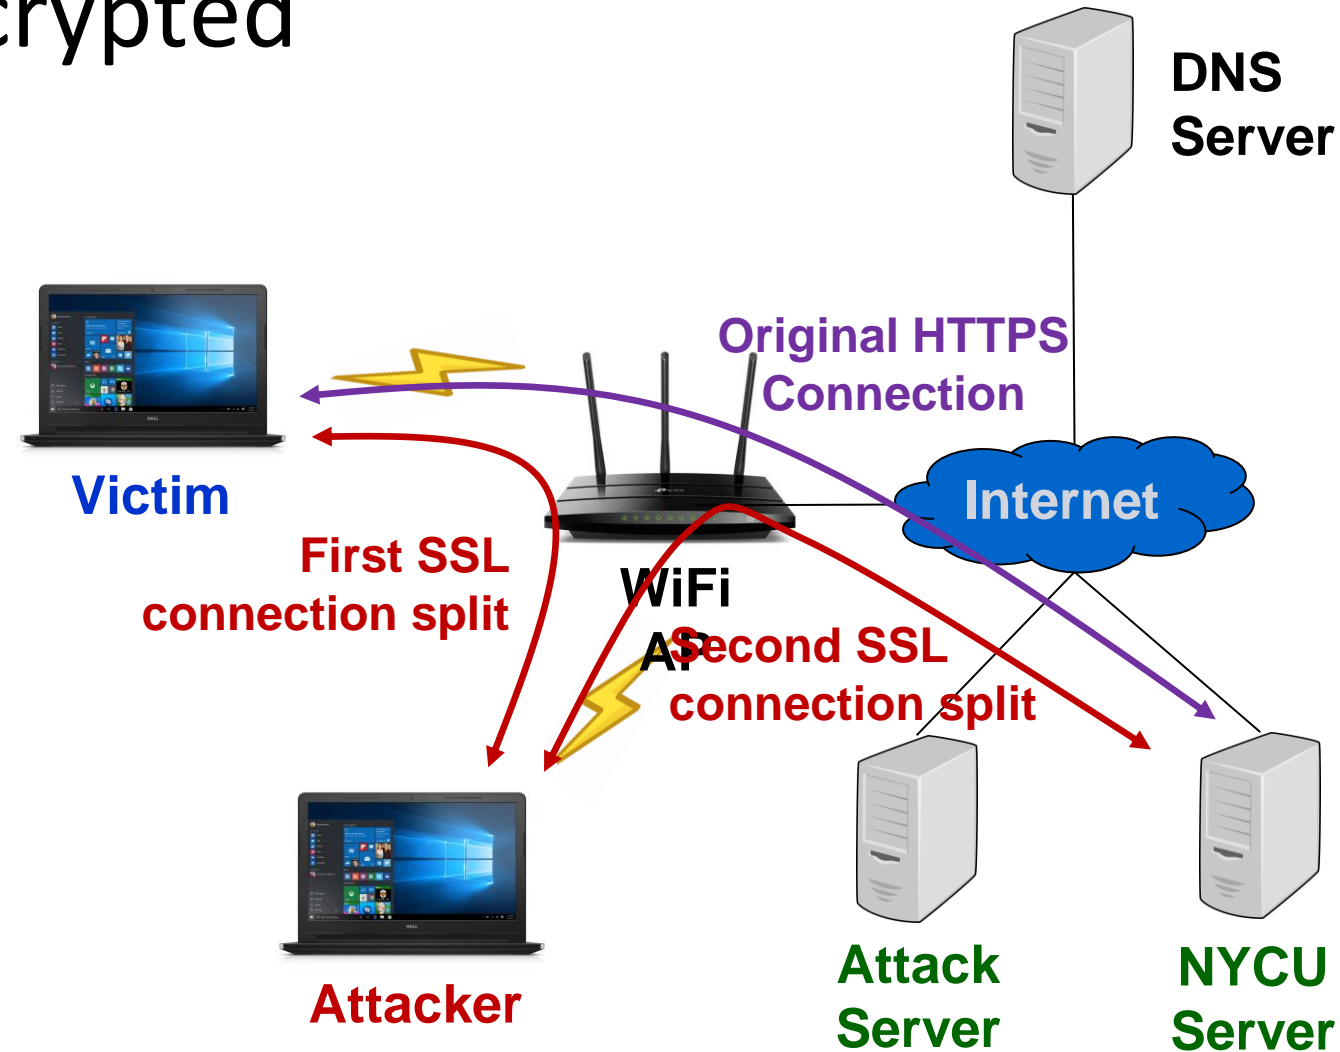

Attacker → AP

AP → Attacker

Attacker → Victim

Task III: SSL Split on Encrypted SSL/TLS Connections

- Split SSL/TLS connections
 - ❑ You can use 'sslsplit' command as a tool for this attack against encrypted network connection
 - ❑ You are allowed to install certificates on the victim

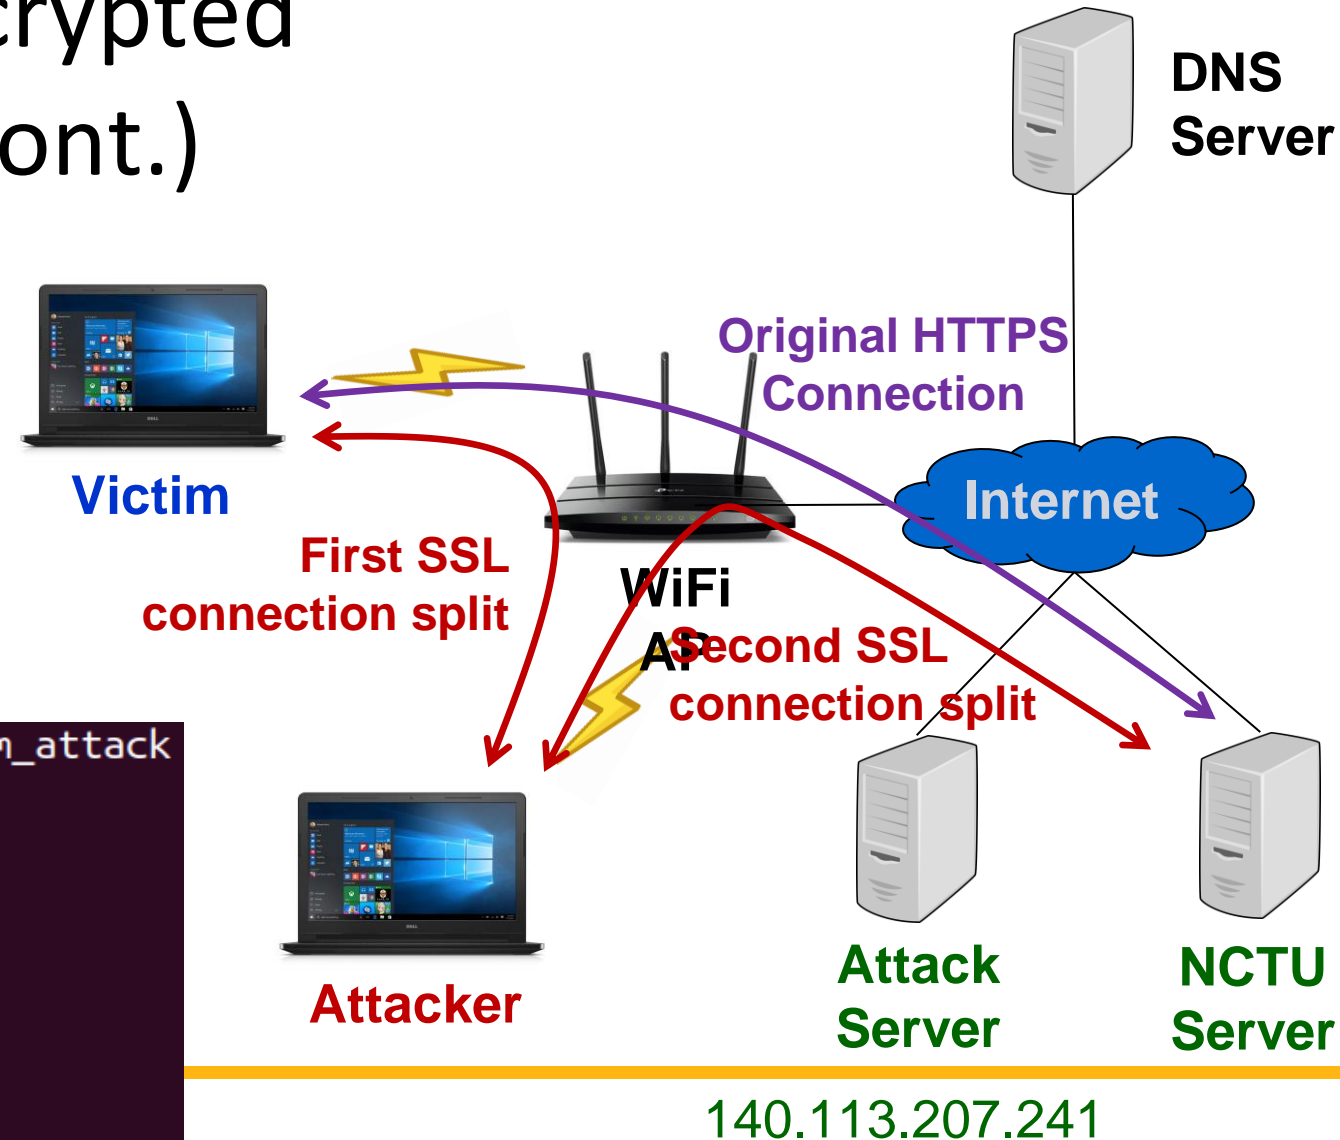

140.113.207.241

Task III: SSL Split on Encrypted SSL/TLS Connections (Cont.)

- Fetch all the inputted usernames/passwords on a specific web page
 - Parse HTTP content to print out usernames/passwords

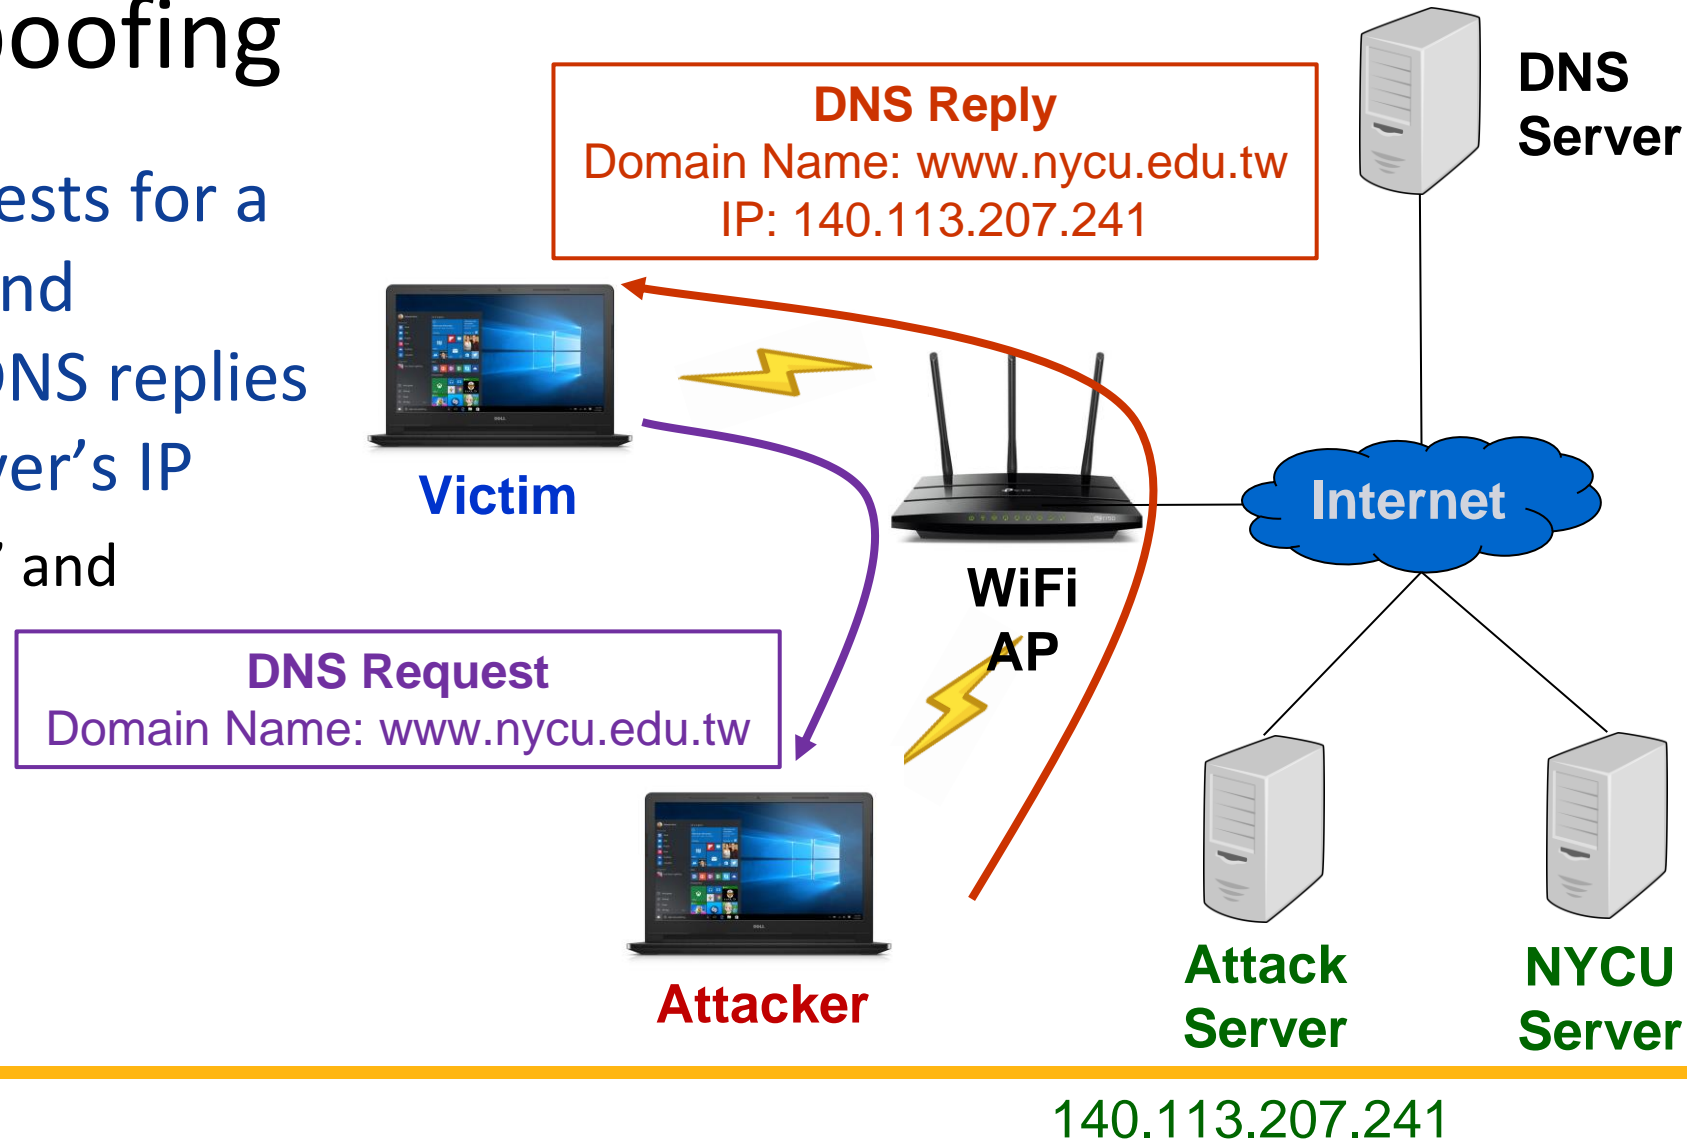

```
cs2021@ubuntu:~/Desktop/project2$ sudo ./mitm_attack
Available devices
-----
IP                MAC
-----
172.16.186.1       00:50:56:c0:00:08
172.16.186.141     00:0c:29:f2:d2:ab
172.16.186.254     00:50:56:ed:bd:5e

Username:  this_is_demo_username
Password:  this_is_demo_password
```

Task IV: DNS Spoofing

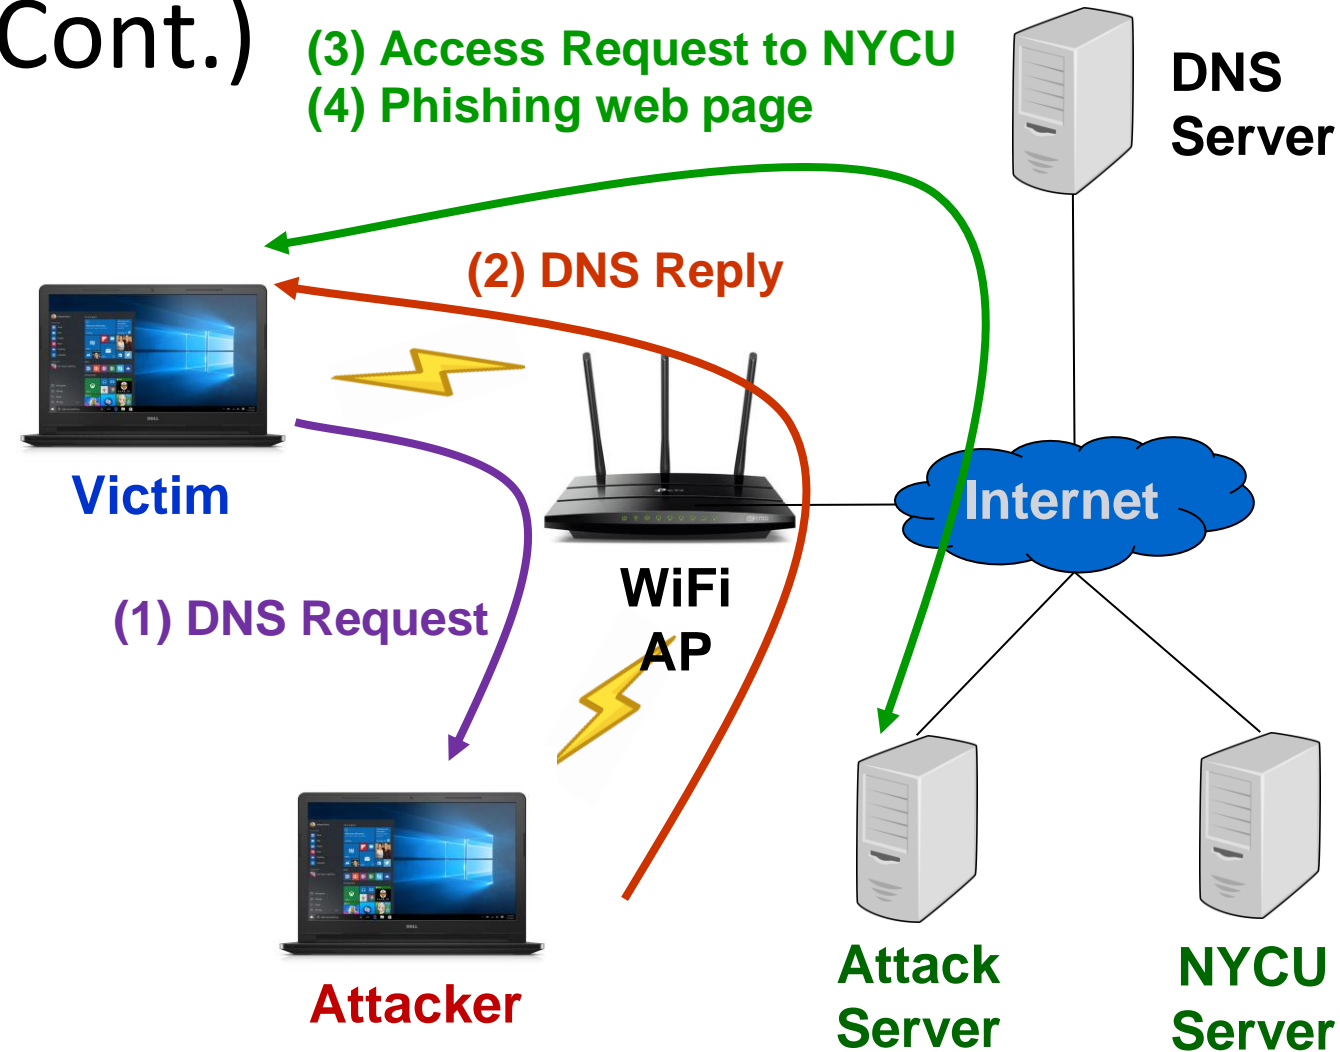

- Intercept DNS requests for a specific web page and generate spoofed DNS replies with the attack server's IP
 - You can use 'scapy' and 'NetfilterQueue' library in Python

Task IV: DNS Spoofing (Cont.)

- Successful attack

- ❑ An access request to NYCU home page will be redirected to the attack server (140.113.207.241)
- ❑ A phishing web page will be shown to Victim

140.113.207.241

Requirements

- You need to develop/run your program in a given virtual machine
 - VM image: Please download it from [Link](#)
 - Username/password: csc2023/csc2023
- You are allowed to use C/C++ and Python
- You are allowed to team up. Each team has at most 2 students
 - Teams: discussions are allowed, but no collaboration
- Please submit your source codes to New E3

Test Scenario I: Target Scenario

- However, this scenario does not work for all the combinations of OS and VM software
 - ❑ Working: Linux + VirtualBox/VMware
 - ❑ Not working properly
 - Windows + VirtualBox/Vmware
 - MacOS + VirtualBox
- You can choose Test Scenario II

Test Scenario II: Alternative Scenario

- VM2 (Attacker) launches attacks on VM1 (Victim)
 - ❑ NAT mode shall be used for VMs
- Host is similar to the role of the AP in Test Scenario I
 - ❑ Scenario I: The Wi-Fi devices are in the same subnet
 - ❑ Scenario II: The VMs are in the same subnet
- Host can be connected to the Internet via Wi-Fi or wired Ethernet

Important: How to Prepare Your Attack Programs?

- Must provide a **Makefile** which compiles your source codes into two executable files, named **mitm_attack** and **pharm_attack** (Missing: -20%)
- Test requirements for the programs
 - ❑ Must be run in the given VM without any additional tools or libraries
 - ❑ Must use the following parameters
 - Test web page in the man-in-the-middle attack: <https://e3.nycu.edu.tw/login/index.php>
 - DNS spoofing for the NYCU home page: <http://www.nycu.edu.tw>
 - Attacker server IP in the DNS spoofing: 140.113.207.241
 - ❑ Must work for the test commands: `./mitm_attack` and `./pharm_attack`

Important: How to Prepare Your Attack Programs?

- Results from the MITM attack (./mitm_attack)
 - ❑ Print out the IP/MAC addresses of **all the Wi-Fi devices or VMs** except for **Attacker and AP/Host**
 - ❑ Print out the username and password which a user submits to the website <https://e3.nycu.edu.tw/login/index.php> using any of **the Wi-Fi devices or VMs**
- Results from the pharming attack (./pharm_attack)
 - ❑ Print out the IP/MAC addresses of **all the Wi-Fi devices or VMs** except for **Attacker and AP/Host**
 - ❑ Redirect the NYCU home page (www.nycu.edu.tw) to the phishing page (140.113.207.241)
- Demo
 - ❑ Verify the MITM attack by giving inputs on the website using **one Wi-Fi device or VM**
 - Only allowed to run ./mitm_attack (No manual configuration is allowed)
 - ❑ Verify the pharming attack by accessing the NYCU page on **one Wi-Fi device or VM**
 - Only allowed to run ./pharm_attack (No manual configuration is allowed)

Project Submission

- Due date: 4/12 11:55pm
- Makeup submission (75 points at most): TBA (After the final)
- Submission rules
 - ❑ Put all your files into a directory and name it using your student ID(s)
 - If your team has two members, please concatenate your IDs separated by “-”
 - ❑ Zip the directory and upload the zip file to New E3
 - ❑ A sample of the zip file: 01212112-02121221.zip
 - Makefile
 - mitm_attack.cpp
 - mitm_attack.h
 -

Online Project Demo

- Date: 4/14
- Makeup submission (75 points at most): TBA (After the final)
- TA will prepare your zip file and run your programs for the demo on behalf of you
- You will
 - ❑ be asked to reproduce your MITM and pharming attacks
 - ❑ be only allowed to “make” to compile all your files, and run your attack binary programs or scripts
 - ❑ be not allowed to modify your codes or scripts
 - ❑ be asked some questions
 - ❑ be responsible to show and explain the outcome to TA

Questions?
